

The Evolution to Password[less]

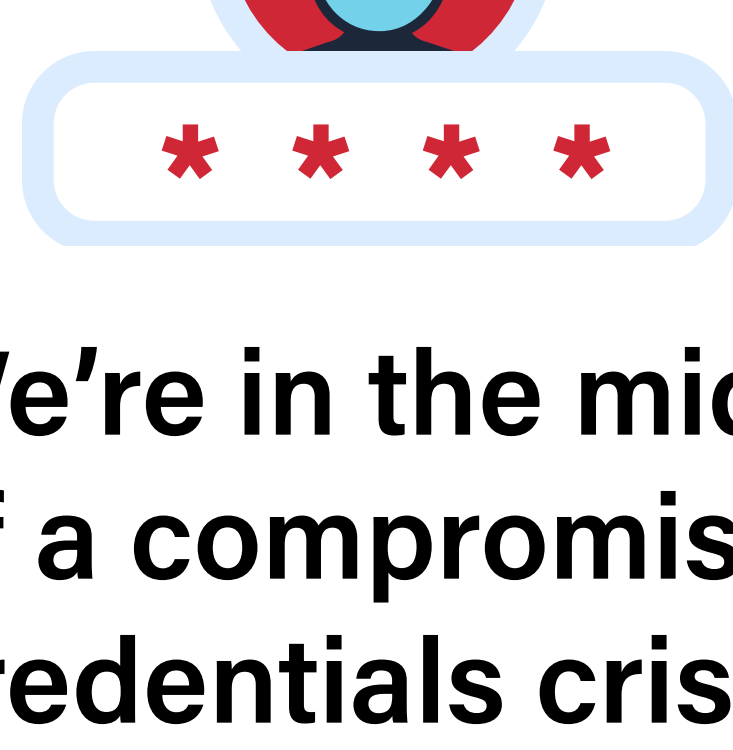

of organisations experienced more than one data breach during 2022.¹

of these data breaches are the result of compromised login credentials.²

We're in the midst of a compromised credentials crisis. What can be done when passwords are becoming more of a problem than a solution?

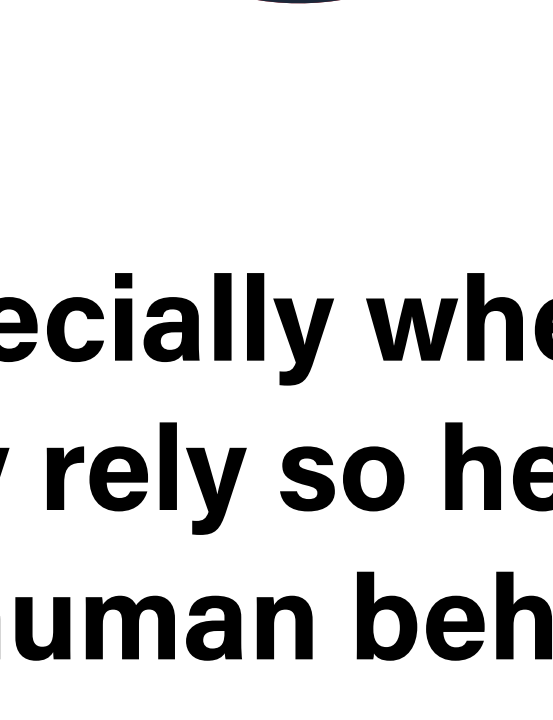

Password[less] envisions a world that relies less on passwords in order to keep our credentials more secure.

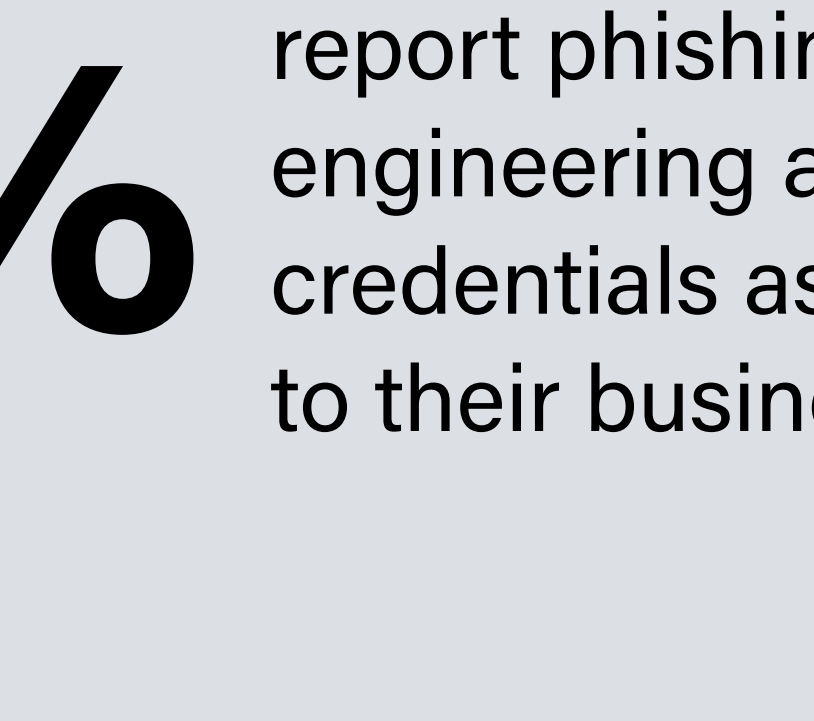

In the midst of this evolution to password[less], where does your company stand?

Passwords keep us safe, but they're also used against us.

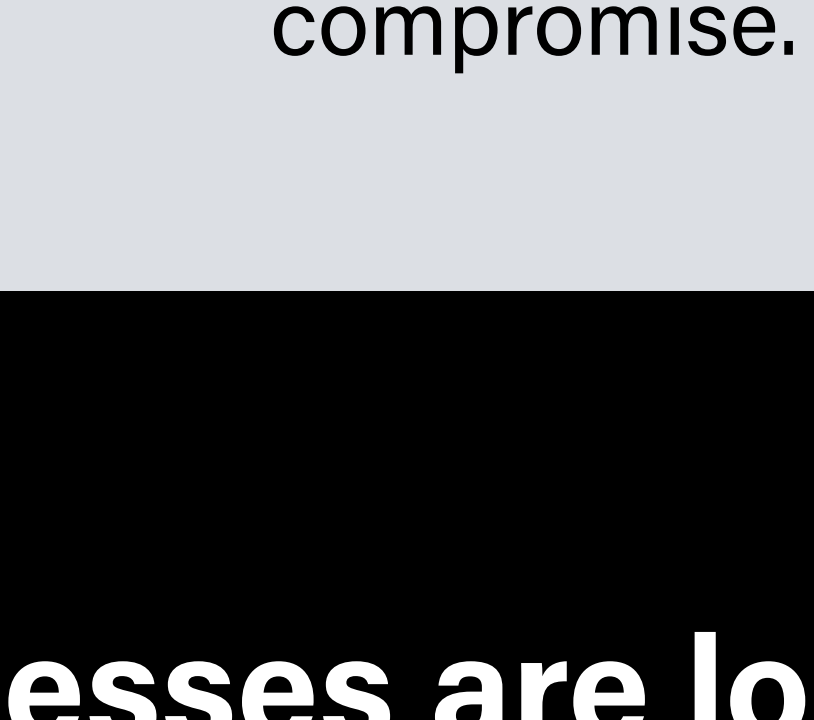

Especially when they rely so heavily on human behaviour, which can be easily exploited.

48%

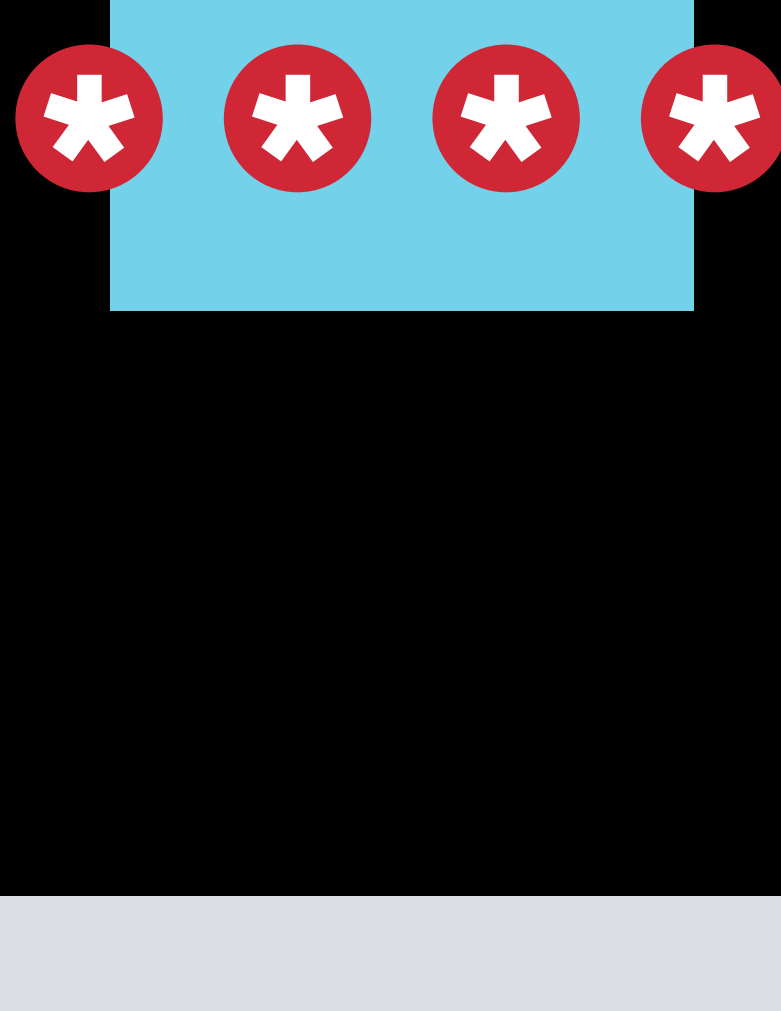

report phishing, social engineering and compromised credentials as the biggest risks to their businesses.

49%

of IT leaders are concerned about malware, brute force attacks and business email compromise.

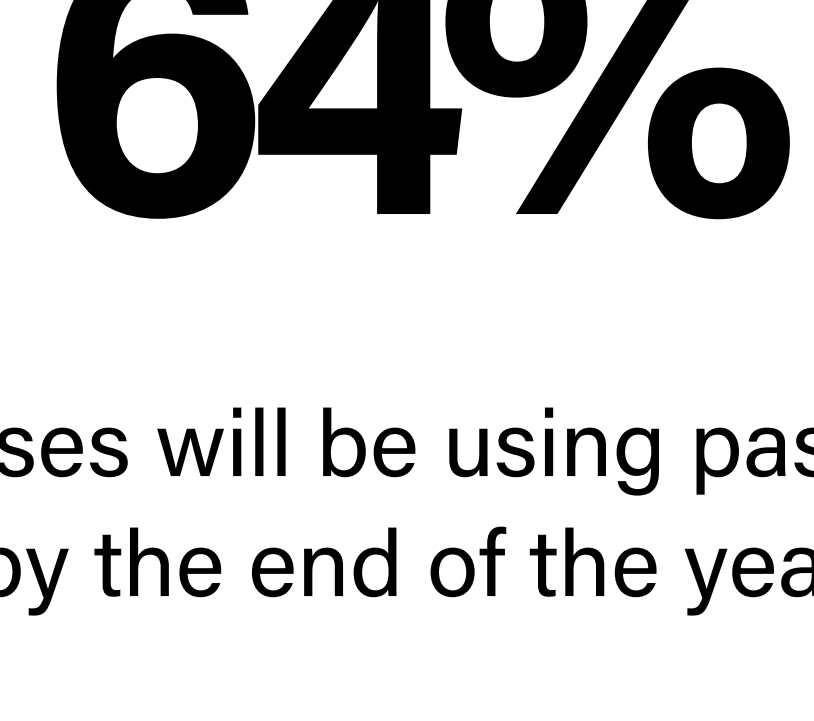

Businesses are looking to what they know to get them to password[less].

37%

of respondents think password managers are the best way to transition an organisation to password[less].

The end of 2023 will be an important milestone in this evolution.

64%

of businesses will be using passwordless by the end of the year.

Reduction of cyber risk is the main driver for passwordless according to 71% of IT leaders –

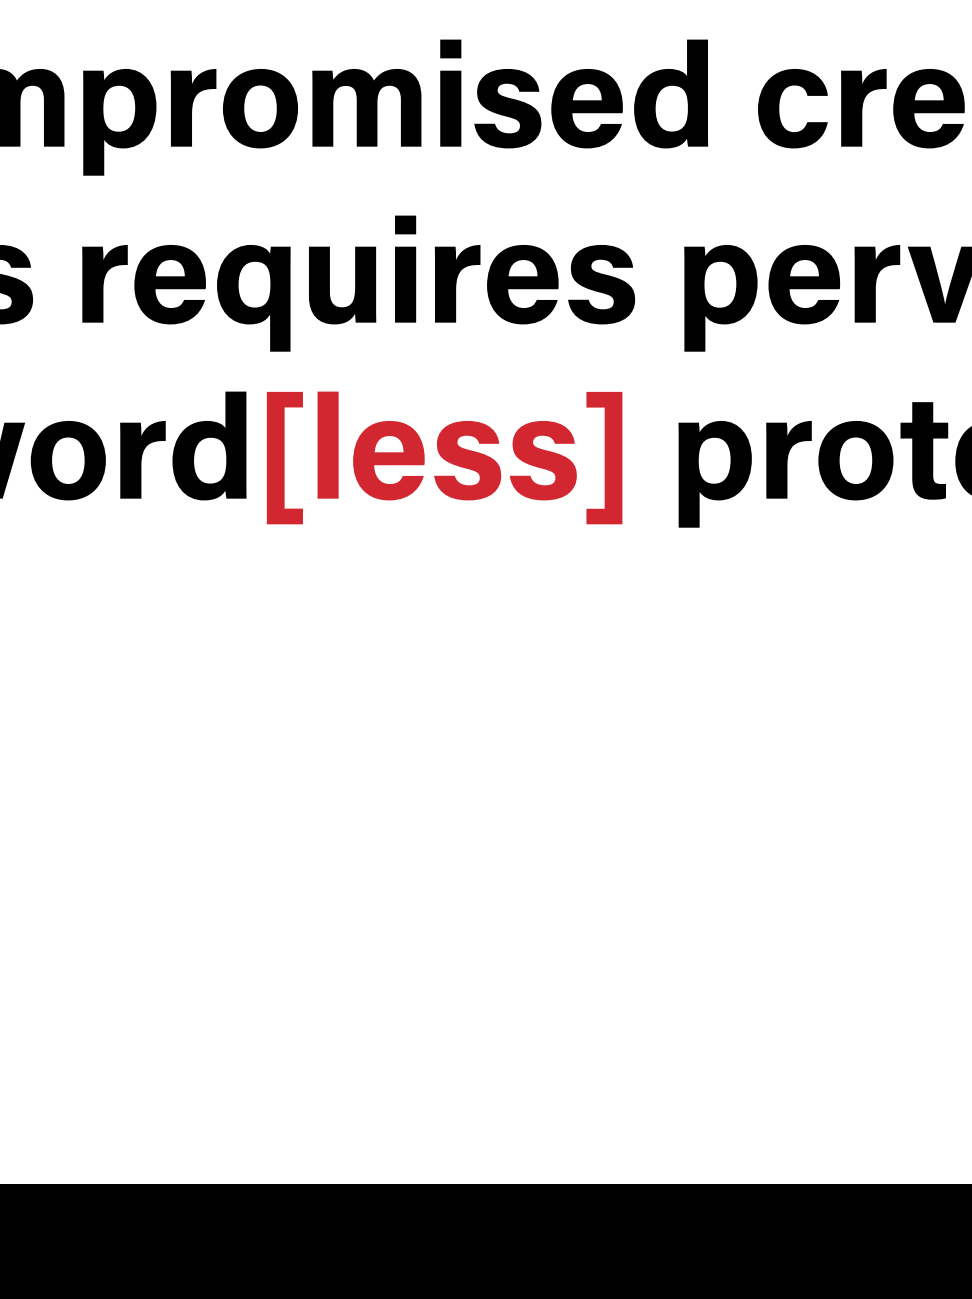

yet, paradoxically, 40% are concerned about the security offered by passwordless providers.

Paskeys will play an important role.

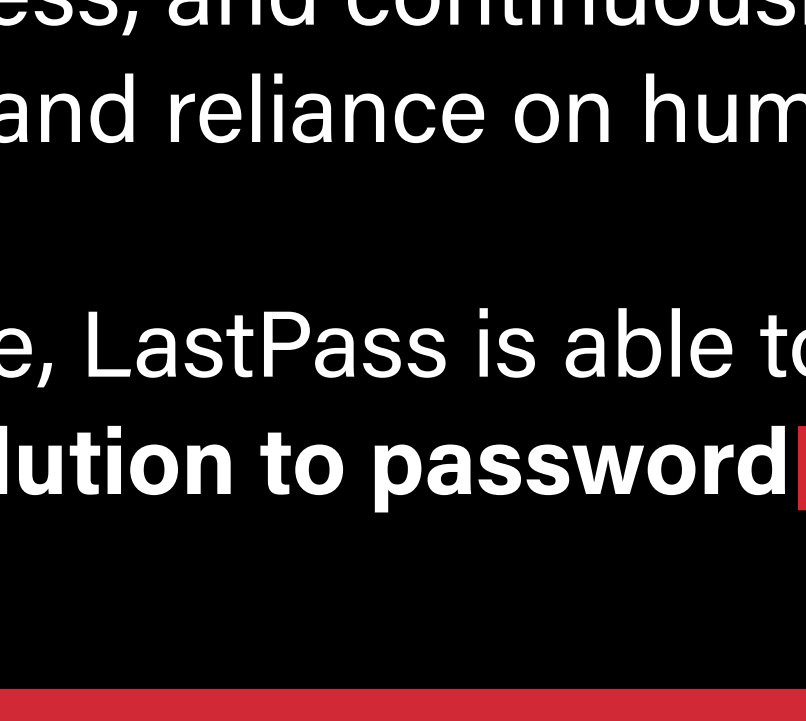

91%

of respondents believe they will have a significant impact on their business environment.

LastPass and your evolution to password[less]

The compromised credentials crisis requires pervasive password[less] protection.

With LastPass, businesses of all sizes eliminate vulnerabilities by increasing password security across their entire business, and continuously reduce the use of passwords and reliance on human behaviour.

Wherever you are, LastPass is able to meet you on your evolution to password[less].
